① 行列 P,Q,R,S を次のようにおく. これらの組み合わせのうち、積が定義できる場合すべてについて、その積を計算せよ.

$$P = \begin{pmatrix} -2 & 1 & -1 \end{pmatrix}, \qquad Q = \begin{pmatrix} 1 & 1 \\ 2 & -1 \\ -1 & 2 \end{pmatrix}, \qquad R = \begin{pmatrix} -1 \\ 1 \\ 2 \end{pmatrix}, \qquad S = \begin{pmatrix} 3 & -2 & 1 \\ -2 & 1 & -1 \end{pmatrix}$$

2 Initially, three firms A, B, and C (numbered 1, 2, and 3) share the market for a certain commodity. Firm A has 20% of the market, B has 60%, and C has 20%. In the course of the next year, the following changes occur:

A keeps 85% of its customers, while losing 5% to B, and 10% to C

B keeps 55% of its customers, while losing 10% to A, and 35% to C

C keeps 85% of its customers, while losing 10% to A, and 5% to B

We can represent market shares of the three firms by means of a *market share vector*, defined as a column vectors \vec{s} whose components are all nonnegative and sum to 1. Define the matrix T and the initial market share vector \vec{s} by

$$T = \begin{pmatrix} 0.85 & 0.10 & 0.10 \\ 0.05 & 0.55 & 0.05 \\ 0.10 & 0.35 & 0.85 \end{pmatrix} \quad \text{and} \quad \vec{s} = \begin{pmatrix} 0.2 \\ 0.6 \\ 0.2 \end{pmatrix}$$

Notice that t_{ij} is the percentage of j's customers who become i's coustomers in the next period. So, T is called the *transition matix*.

a) Compute the vectot $T\vec{s}$.

b) Show that it is also a market share vector.

c) What is the interpretation of $T(T\vec{s})$, $T(T(T\vec{s}))$,...?

③ a)
$$A=\left(egin{array}{cc} a & b \\ c & d \end{array}
ight), \ B=\left(egin{array}{cc} d & -b \\ -c & a \end{array}
ight)$$
とする. AB および BA を求めよ.

b)
$$A=\begin{pmatrix}a&b\\c&d\end{pmatrix}$$
 とする。a) を利用して $ad-bc\neq 0$ のとき $PA=\begin{pmatrix}1&0\\0&1\end{pmatrix}$ となる行列 $P=\begin{pmatrix}p&q\\r&s\end{pmatrix}$ を求めよ。また,このとき $AP=\begin{pmatrix}1&0\\0&1\end{pmatrix}$ となることを確かめよ。

c)
$$A = \begin{pmatrix} 2 & -5 \\ 3 & 4 \end{pmatrix}$$
とする. $PA = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}$ となる行列 $P = \begin{pmatrix} p & q \\ r & s \end{pmatrix}$ を求めよ.

d)
$$A=\begin{pmatrix}2&-5\\3&4\end{pmatrix}\begin{pmatrix}x\\y\end{pmatrix}=\begin{pmatrix}-1\\2\end{pmatrix}$$
 の両辺に b) で求めた P を左から掛けることにより、 $\begin{pmatrix}x\\y\end{pmatrix}$ を求めよ.

e)
$$\begin{cases} 2x - 5y = -2 \\ 3x + 4y = 3 \end{cases}$$
 を解け.
